Pacific® Wedgeplug Valves

CRANE

Crane ChemPharma & Energy

www.cranecpe.com

Heritage of Innovation and Quality

Crane Co. is a diversified manufacturer of highly engineered industrial products, founded in 1855. Crane has approximately 11,000 employees in the Americas, Europe, Asia and Australia, and is traded on the New York Stock Exchange (NYSE:CR).

Pacific Valves® Wedgeplug valves are chosen for delayed coker isolation where the service is not only high temperature, but presents other valve designs with seating issues when decoking occurs. Wedgeplug's unique seating arrangement ensures that seats are protected from the media in both the seated open and seated closed position. Combined with the purging options during the opening and closing cycles, Pacific Wedgeplug proves that there is no other valve with the design and experience, to handle severe services.

When you buy products from us, you get much more than just valves:

Performance Advantages

Compared with alternative valve designs, Pacific Wedgeplug provides superior protection from: erosion damage; solids build-up on sealing surfaces and in cavities; residual freeze up which can prevent operation and cause leakage due to packing wear.

Effective and Versatile

Crane's Pacific Wedgeplug non-lubricated metal-seated plug valves were designed more than 80 years ago to address valve problems associated with catalyst cracking service. Today, they are utilized readily in hot, dirty and severe refining applications, including delayed coking, ethylene cracking, asphalt production and residue reduction.

Quality Assured

Pacific Wedgeplug valves are designed to ASME B16.34, API Standard 599 and API Standard 600, latest edition, where applicable. Testing is to API Standard 598, latest edition. Special hydrostatic testing and non-destructive examinations are available.

Manufacturing: Signal Hill, California

Design Features

Key Features & Benefits

With industry-leading low steam usage and zero steam consumption when not actuating, the Pacific Wedgeplug delivers superior operational savings and reduced total cost of ownership.

- 1 As the Wedgeplug consumes steam only during activation (actively opening or closing), not only are steam costs reduced but downstream process yields are improved and system corrosion rates reduced. Additionally, any loss of steam pressure when the valve is seated does not affect valve function, reliability or safety.
- 2 Top pull-out design allows the body to stay in the piping while the top works are removed for inspection, hydro-blasting and maintenance. This reduces rigging and pipe work costs and shortens turn around schedules and reduces the overall cost of maintenance throughout the life of the valve.
- 3 Metal-to-metal bi-directional seal eliminates orientation concerns and delivers double block and bleed/ purge capability in a single valve, increasing operational safety.

(plug detail)

Wedgeplug Technical Specifications

Simplifying Severe Service

Process valves in severe service applications are especially susceptible to the negative effects of wear, which can reduce their performance and lifecycle. The compressive interface of sealing elements in traditional Wedgeplug designs make the introduction of highly-abrasive fluids especially problematic, as they attack machine finishes and impede the valve's ability to function. Pacific Wedgeplug eliminates this action and reduces valve deterioration with frictionless operation between elements. This design extends valve reliability during shutoff and reduces repair costs in extreme applications, delivering the lowest total cost of ownership.

- ASME Classes 150-1500.
- Temperature from cryogenic to 1650°F (900°C).
- Sizes ½ in (15 mm) through 36 in (900 mm).
- Plug port of reduced (70%, 90%) and full bore (100%).
- Designed to requirements of:
 - API 599
 - ASME B16.5 flanges
 - ASME B16.10 face to face
 - ASME B16.34
 - Flanged, threaded or butt-welded
- Fire tested to API Standard 607, API Standard 6FA and British Standard BS6755.
- Materials include WCB, CF8M, C5, C12, WC6, WC9, and Incoloy 800H.
- Special configurations and alloys available.

Design Simplicity

Body

The body features dual, integral metal seats that provide metal-to-metal, bi-directional in-line sealing. The raised seats are completely protected from the process flow in both the fully-open and fully-closed positions. There are no cavities to permit process build-up, no leak paths behind the seat and no thermal expansion problems. Inherently fire safe, a single Wedgeplug valve provides double block-and-bleed service. End connections include: raised face, ring joint and flat face flanges; butt weld; screwed ends; socket weld; and Grayloc® hub.

Seats

The unique lift-and-turn operation of the Wedgeplug valve allows the valve to operate with virtually no rubbing of the seat and plug.

Because there is no contact during valve operation and the seats are protected from the process flow in both the open and closed positions, there is no need for overlays on the seats. The seats are integral cast to the body and ground to a mirror-like finish that matches the plug and ensures tight metal-to-metal sealing.

Special metallurgy and hard-facing surfaces including Stellite® and Ultimet® can be furnished per customer request.

Plug

Precision ground from hardened high-alloy material or overlaid stainless steel, Wedgeplug's tapered plug ensures a tight seal and easy operation. The durable surfaces resist damage in the most severe applications, delivering years of reliable service.

The optional Q-plug provides full port flow along with less weight and easier maintenance. Other enhancements include trunnion mounting to eliminate side loads for prolonged seat life, tangential purge, and heavy-duty mounting yoke design.

Bonnet

Top entry to the body allows in-line disassembly and repairability. The plug, stem, yoke and actuator can be removed as a single unit for inspection, cleaning and repair. This is a significant cost and maintenance benefit, especially for valve sizes 12" (300 mm) and larger.

®Grayloc is a registered trademark of Gray Tool Company.

®Stellite is a registered trademark of Deloro Stellite, Inc.

®Ultimet is a registered trademark of Haynes International, Inc.

Additional Features

Hard Seating Surfaces

Hard facings on the plug and body seats are not required due to the unique, non-contact turning motion of the Wedgeplug and can be furnished to customer request. The hardened metal plugs are then machined to a mirror-like finish for tight sealing and low torque. Wedgeplug valves with hard facings are recommended for high temperature corrosive and erosive steam and oil or oil vapor services.

A Choice of Seats

Metal-seated valves are recommended in extreme temperatures and abrasive media applications. Although hard facings are not required due Wedgeplug's unique method of operation and non-contact turning motion, they can be provided per customer request with special metallurgy.

Bonnet, Stem and Seal Options

- Extended bonnets for cryogenic service.
- Heat dissipating fins for temperatures > 1000°F (535°C).
- Trunnion mounts handle high differential pressures and prevent side loading.
- Packing and gland assembly with two-piece ball and socket-type joints assures alignment and proper packing compression without stem binding. Standard packing is Grafoil®. A wide variety of packing configurations is available.

Purging and Flushing (see illustration page 9)

The unique seat action of the Wedgeplug valve delivers the industry's most efficient purge steam utilization. Unlike other designs that require a continuous steam flow, the Wedgeplug shuts off purge steam in the fully-open and fully-closed positions, greatly reducing energy expenditures throughout the life of the valve.

Steam Jacketing

Steam jacketed valves are available to handle highly viscous media such as tars and pitches. They may be obtained in ASME Class 150 and 300, sizes 1 ½ in (40 mm) thru 10 in (250 mm).

Simple Automation

Wedgetorque operators come standard with every valve. Providing optimum torque seating, they ensure tight bi-directional sealing while overcoming seat wear and process temperature variations. They enable easy manual operation or can be simply automated with electric, pneumatic or hydraulic actuators.

®Grafoil is a registered trademark of GrafTech International Holdings Inc.

Typical Applications

Petroleum Refining Delayed Cokers

- Inlet/Transferline Isolation
- Overhead Isolation
- Module Isolation
- Heater Isolation

FCCU & RCCU

- Slurry/Cycle Oil Pump Isolation
- Catalyst Withdraw & Addition
- 3rd Stage Cyclone Block
- Strainer Isolation
- Cat Fines Block Valves
- Fractionators Emergency Shutdown Valve
- Coker Pot Strainer

Asphalt Plants Residue Reduction

Petrochemical Ethylene/Steam Crackers

- Furnace Isolation
- Transferline Valves
- Decoke Valves
- Bypass Valves
- Strainer Isolation

MDI/MDA

Other

- Fossil Fuel Power Generation
 - Fly Ash Handling
- ### Coal Gasification

Enhance Valve Performance

Enhance Performance & Extend Valve Life

To provide consistent seating performance and prolonged valve life, it is recommended that you purge and flush your Pacific Wedgeplug valve each time it is operated.

By purging and flushing, you can:

- Clean the seating surfaces, helping to deter damage caused from solids traveling in the process stream.
- Create a third dynamic seal in the valve in addition to the upstream and downstream seats by introducing the purge media.
- Use the purge media to create a safety blanket, thus eliminating escape paths for the process media.

Another benefit inherent in the Wedgeplug design is that the purge media is only consumed when the valve is being opened or closed. This greatly reduces the overall energy consumption and the subsequent removal of media from the process stream.

Guidelines for Purging and Flushing

Purge and flush Pacific Wedgeplug valves using steam, air, nitrogen or process compatible liquids following these parameters to enhance valve performance.

- Steam purge must be applied at 25 PSIG min/50 PSIG max above process line pressure.
- Air or nitrogen purge must be applied at 25 PSIG min/50 PSIG max above process line pressure.
- Liquid purge must be applied at 5 PSIG min/10 PSIG max above process line pressure.

To ensure maximum benefit, follow the guidelines below when establishing purging and flushing procedures.

- Purge media should be compatible with process media.
- Systems temperature and purge temperature should be similar.
- Supply lines should have no restrictions (orifices) without prior consultation of Pacific Wedgeplug.
- Supply header should be sized for adequate volume.
- Pressure and temperature gauges should be placed in critical areas to monitor purge media.
- Steam purge lines should be as short as possible to prevent condensate build-up.

Wedgetorque Operators

All Wedgeplug valves are supplied with Wedgetorque operators to ensure optimum torque seating, providing the following features and benefits:

- The Wedgetorque lifts the non-lubricated plug and rotates it 90°, reseating it as torque is transmitted to the operating screw.
- The Wedgetorque provides positive seating from mechanical thrust, ensuring tight sealing of upstream and downstream seats.
- Automatic compensation for wear and process temperature variations.
- The Wedgetorque is manufactured and stocked in several group sizes for a full range of Wedgeplug valves.
- Originally supplied Wedgeplug valves with screw-type operators, can be easily refurbished with new yokes and Wedgetorque operators.

Illustrated Purging Process

In this picture, the valve is in the closed, seated position with the seats protected. The line media is colored and the purge/flush media is shaded yellow.

With the valve, we have three sealing elements:

- The upstream primary mechanical seal of the plug against the body.
- The internal static purge, i.e., steam seal.
- The downstream secondary mechanical seal of the plug against the body.

The plug is slightly lifted (approximately ¼ to ½ inch) causing a high velocity flushing action of the line media from the seat areas.

- The flushing action is achieved as the compressed purge media is released to become the flush media when the plug unseats.
- As the valve rotates 90 degrees between open and closed, the particulate matter is flushed back into the process.
- The additional benefit of lifting the plug is the low friction and low torque required to cycle the valve.

As the plug rotates, the flush is continuously fed through the two purge/flush feed lines.

Two points to note:

- The purge/flush lines should never be turned off unless the valve is to be maintained or removed from the line.
- Careful sizing of the steam manifold (assuming that steam is the purge/flush medium of choice) is critical, as well as the trapping and insulation of the steam lines.

The plug is seated in the open position with the seats once again protected.

- Seating the plug automatically stops the flushing process and the purging is resumed, creating a purge seal or barrier.

Materials of Construction

Note:
Pacific Wedgeplug intent is to show *typical* materials of construction. Materials are subject to change without notice and without obligations. Other material and combinations are available upon request.
